

40M LDM Model

Introduction

Laser Tech latest generation of Laser distance measurement modules offers measuring ranges up to 40 meters. The Laser Distance Measuring compact units with the smallest dimensions ever: only 48.9 x 26 x 13 mm. They are designed for users to easily connect the Laser measurement unit to a PC or an MCU through RS232 communication (UART TTL). The unit has a 1mm resolution and an accuracy of $\pm 3.0\text{mm}$ along with a sampling rate up to 3 Hz.

The typical UART output uses a serial RS232 with a standard communication transmission protocol, which is the most common configuration for PC serial communications today. The common line speed has a Baud Rate of 19200.

Control flow chart

All communication commands are issued by the master board, the laser rangefinder module acts as the slave that answers to the master's request. The Ask & Answer flow through UART commands is shown in Figure 3.

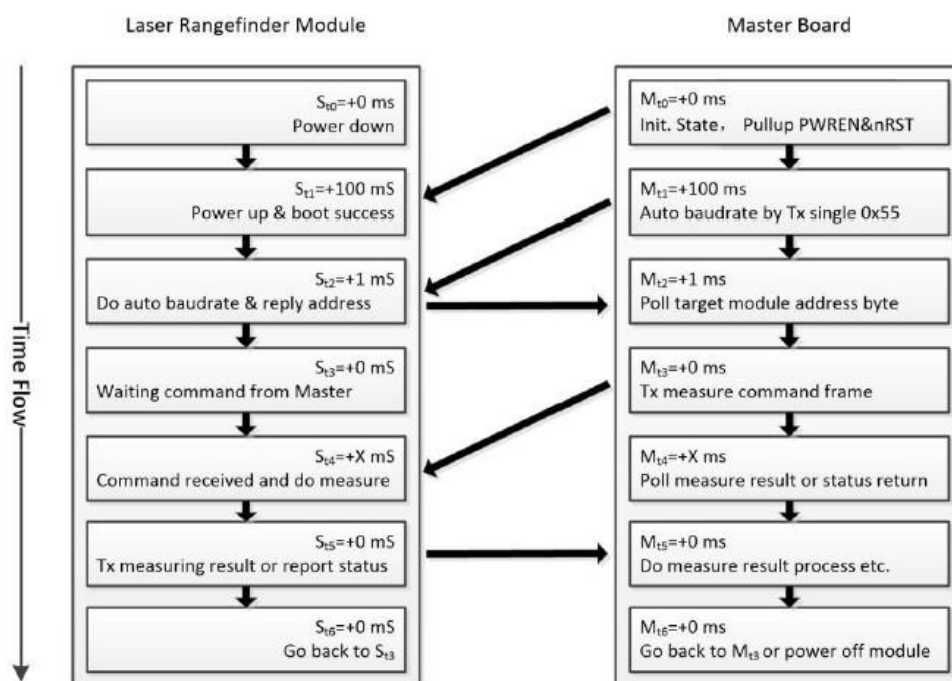

Fig. 3

In its initial state, the module (slave) is in power-down mode before the master pulls the PWREN up. After PWREN is pulled up, and if nRST had been used before, please also remember to de-assert the nRST by pulling it up again. The module will take about 100 milliseconds to proceed to self-boot then the master transfers 1 byte data 0x55 to the slave. If it succeeds, the slave will reply 1 byte data to the master which is the slave own address (default address is 0x00). After this step, the communication between master and slave is established and now the master can send commands to the slave.

Measurement Mode

Each measurement mode has 3 working attributes

- **Auto**
In this mode, the module adjusts its measuring speed according to the environmental conditions of the laser and the target
- **Slow**
The speed is set to its minimum to increase the measurement accuracy
- **Fast**
The speed is set to its maximum, but the accuracy will be lower

Notice

- Users should always remember to turn OFF the power of the Laser Distance Measuring Kit when the measurement is complete, as keeping the power ON might reduce the life-time of the Laser and of the laser sensor inside the Laser Distance Measuring Kit.
- Resistors of a few hundred Ohm are preferentially added between the pins UART Rx, UART Tx and the user's MCU in order to limit the voltage discrepancy between the two systems, which would lead to current losses.
- The measure rate changes automatically based on the aimed target reflectance and the environmental conditions.
- Continuous testing at low temperatures (0°C) should not exceed 30 minutes.
- Measured targets should avoid direct light exposure.
